

ABSTRACT OF THE DISCLOSURE

An audio processor comprises a control device
which fetches in, when executing one process, a program
and data stream corresponding to next process from an
5 external memory device, an internal memory which stores
the program and data stream read from the external
memory device and corresponding to the one and next one
of the processes, and a processor which subject the
input data stream to the process based on the program
10 and data stream read from the internal memory.
